

Assumption:

User can has many accounts, so one user can purchase many or 0 subscription.

"Up to two phone numbers" is set to multi-value attribute.

Payment details would be deleted if subscription cancelled, so it's a weak entity.

Since "show" doesn't have many attributes and key, so I made relationship between film/series to user directly.

Assume URL is unique for each film and series.

Assume "address" in purchase's contact details has a few attributes included, so treat it as composite attribute.

Episode is depends on season and season is depends on series because episode and season cannot exist by it's own.

Since top 10 list has no unique attribute, so make "rank", "start date" and "end date" as primary key.
